THE NEW SEALABLE INTERVAL FILM MATERIALS WITH LUMINESCENT LAYER ..... 20
- In the given technological process polypropylene films, modified in accordance with the method of dry stretching are used as the main material. They have microporous structure that provides the achievement of high printing abilities of the basis during the coloring with water-dispersive luminescent coloring systems. Interval luminescent coloring of the basis is performed using the method of ink jet printing by means of water-dispersive luminophore systems with the following two-side lamination with polymeric film, which contains thermally activated layer. The obtained multilayer material is used for production of such means as threads, tapes (stripes), fiber, confetti, that protect paper from unauthorized manufacturing.
- Keywords:** photoluminescence, polymer crazing, microporous membranes, luminophore, ink jet printing.
