ПРОБЛЕМЫ УПРАВЛЕНИЯ

1.2006

СОДЕРЖАНИЕ

Управление в социально-экономических системах

- Эпштейн В. Л. Тезисы В.А. Трапезникова в контексте теории постиндустриализма 2
Зенькова Л. П. Инвестиционная теория циклов и трансформационная экономика Беларуси. 6
Сачук Т. В. Разработка деловых стратегий развития территории. 12
Колемаев В. А. Исследование поведения модели Самуэльсона-Хикса. 16
Радько С. Г. Оценка трудового потенциала специалистов управленческого звена 20

Информационные технологии в управлении

- Подлазов В. С., Стецюра Г. Г. Регулярные плоские сети для суперкомпьютеров. 26
Выхованец В. С. Разнесенный грамматический разбор. 32

Системный анализ и обработка данных

- Мокров Д. В., Бахтадзе Н. Н. Программные анализаторы в системах управления транспортно-экспедиционной компанией: экспериментальное исследование 39
Якубовская Н. Н., Викторов В. К., Лисицын Н. В. Задача оперативного управления транспортной производственной системой. 44

Управление в промышленности

- Шлаин В., Глейбман А., Вагапов Д. Базовые алгоритмы системы автоматического обнаружения и классификации дефектов для управления производством полупроводниковых микросхем 47
Рывкин С. Е., Изосимов Д. Б., Байда С. В. Регуляризация переключений компонент многомерного разрывного управления в реальном скользящем режиме. 54

Управление в медико-биологических системах

- Бакусов Л. М., Ильясов Б. Г., Рамазанов М. Д., Сафин Ш. М. Биологические вычисления: общие принципы 61
Десова А. А., Легович Ю. С., Разин О. С. Принципы формирования диагностически значимых признаков ритмической структуры пульсового сигнала 69

Управление подвижными объектами

- Касимов А. М., Мамедли Э. М., Чернявский Л. Т. и др. Обеспечение стойкости систем управления летательных аппаратов к внешним возмущающим факторам 76

Хроника

CONTENTS & ABSTRACTS

V. A. TRAPEZNIKOV'S THESES IN THE CONTEXT OF POSTINDUSTRIALISM THEORY 2

Epstein V. L.

In postindustrial era, the production of material welfare becomes secondary as against knowledge and information. Therefore, to intensify scientific and technological advance, it is critically important to create the industry for digital educational, reference, and scientific literature. This is a good chance for Russia to occupy a fitting place among postindustrial world leaders not only as natural resources supplier but as a manufacturer of intelligent hi-tech products. Against this background, the paper discusses V. A. Trapeznikov's theses and the key issues of postindustrialism doctrine, and outlines the status quo of present day intelligent resources industry in Russia.

INVESTMENT CYCLES THEORY AND TRANSFORMATIONAL ECONOMY OF BYELORUSSIA 6

Zen'kova L. P.

Cyclic process that take place in post-soviet transformational economy of Byelorussia are described. Capital investments are analyzed on the basis of annual, quarterly, and monthly statistics, and distinctive features of wave processes propagation in investment area and their influence on cyclic waves formation in national production volume dynamics are investigated. Possible variants of specifying GDP dynamics equations and the amount of industrial and non-industrial capital investments are examined. Graphical models were used to explain specific propagation of multiplicative effect of investment into economy distributed in time.

THE DEVELOPMENT OF BUSINESS STRATEGIES FOR TERRITORY GROWTH 12

Sachuk T. V.

The features of marketing approach to territory management are discussed. Two types of business strategies: the portfolio and the growth ones, are offered that allow to set and solve strategic problems of socio-economic development of a territory.

INVESTIGATION OF SAMUELSON-HICKS MODEL BEHAVIOR 16

Kolemaev V. A.

Stability and instability regions of Samuelson-Hicks models are investigated. The paper shows the way to expand stability regions by such model transformation where the lag acceleration should be changed to the lead one.

EVALUATION OF LABOR POTENTIAL OF MANAGEMENT SPECIALISTS 20

Rad'ko S. G.

The paper presents a method for labor potential formulation that allows to specify the content of work team's potential and analyze it with any detailing. It provides the directions of labor potential analysis that enables to control its components taking into account both employee's personalities and corporate targets.

REGULAR FLAT NETWORKS FOR SUPERCOMPUTERS 26

Podlazov V. S., Stetsyura G. G.

A method of commutable flat networks design for developing low-cost supercomputers of personal computers is proposed.

SEPARATED PARSING 32

Vykhovanets V. S.

The paper discusses context programming technology based on the development of a specialized language for solving a specific class of applied problems by concept analysis of the object region and the reflection of its conceptual structure in the concepts of the language produced. A separated parsing technique needed for effective implementation of context programming compiler is described.

SOFT SENSORS IN FORWARDING COMPANY'S MANAGEMENT SYSTEMS: AN EXPERIMENTAL STUDY 39

Mokrov D. V., Bakhtadze N. N.

Experimental investigation undertaken shows the application efficiency of identification techniques and adaptive inventory control al-

gorithms in the optimization of short-term budgeting and flexible pricing in forwarding and shipping companies.

TRANSPORTATION SYSTEM OPERATION PROBLEM 44

Yakubovskaya N. N., Victorov V. K., Lisitsyn N. V.

The problem of transportation system operation is considered. The general problem includes the transportation problem, the problem of minimum path determination on the communication graph, and the assignment problem. The ways to solve the problem are outlined and the appropriate techniques are proposed.

BASIC ALGORITHMS FOR AN AUTOMATIC FAULTS DETECTION AND CLASSIFICATION SYSTEM IN MICROCHIP MANUFACTURING CONTROL 47

Shlain V., Gleibman A., Vagapov D.

Basic approaches to automatic detection and classification of the faults arising in the microchip manufacturing process are considered. A system aimed at microchip manufacturing process improvement is described. Applied image processing and pattern recognition algorithms are discussed along with the algorithms for generating verbal descriptions of the automatically generated fault classes.

REGULARIZATION OF COMPONENTS SWITCHING FOR MULTIDIMENSIONAL DISCONTINUOUS CONTROL IN A REAL SLIDING MODE 54

Rykin S. E., Izosimov D. B., Bayda S. V.

The design of vector algorithms for discontinuous (relay) control in multidimensional systems on the basis of the concepts of instantaneous and average control is considered. Control algorithms are offered characterized by switching regularization of the discontinuous control components due to a special choice of switching surfaces. By an example of current control for a three-phase load fed from a self-commutated voltage inverter, the paper shows that the approach proposed ensures high dynamic performance and accuracy along with minimal switching losses and the compliance with electromagnetic compatibility requirements.

BIOLOGICAL CALCULATIONS: GENERAL PRINCIPLES 61

Bakusov L. M., Ilyasov B. G., Ramazanov M. D., Safin Sh. M.

General principles of calculations organization in human central nervous system subject to natural operational constraints on response speed, memory capacity and the ways of observed values representation are examined. New bioprocessor models are offered based on the proposed methodology of the transition from continuous differential equations to their recursive representation. The analogy between the structures of the obtained bioprocessor models and the parts of human cerebral system are established.

PRINCIPLES OF FORMING DIAGNOSTICALLY SIGNIFICANT VALUES OF THE FEATURES OF PULSE SIGNAL'S RHYTHMICAL STRUCTURE 69

Desova A. A., Legovich Yu. S., Razin O. S.

Basic approaches to forming diagnostically significant values of the features of radial artery pulse signal's shape and rhythmical structure are investigated with reference to human organism state diagnostics. The methodology and equipment for informative features formation are described. The results of experimental research aimed at solving a number of diagnostic problems, in particular, radial artery pulse signal's characteristics data for early stages of infantine arterial hypertension, are included.

ENSURING AIRCRAFT CONTROL SYSTEMS RESISTANCE TO EXTERNAL PERTURBATIONS 76

Kasimov A. M., Mamedli E. M., Chernyavsky L. T., et al.

A method for ensuring the resistance of aircraft control systems to external destabilizing impacts by introducing a backup channel based on fluidic devices is proposed. The paper focuses on the development of an algorithm that provides the desirable accuracy of aircraft's apparent velocity measurement in hard real time.

SECOND RUSSIAN-TURKISH CONFERENCE ON MATHEMATICAL MODELS FOR SOCIO-ECONOMIC PROGRESS 81
